Emergency control center set up with professional know-how

Alarm monitoring centers and emergency control centers are becoming increasingly important. Whether in industry, public safety, the service or information sector – growing security demands require **innovative monitoring systems**. Equipping modern control centers can significantly reduce the workload for employees caused by stress and shift work. Ergonomics, improved overview and correct alarm prioritization are also decisive advantages. As a professional equipment supplier, the JST team knows all the important requirements for emergency control centers.

TALK TO US ABOUT

Indispensable! These benefits argue for an emergency control center from JST:

- **Ergonomics:** Modern setting creates an attractive working atmosphere
- **Efficiency:** Proactive alarm visualization reduces response times and stress
- **Overview & handling:** Reduction of monitors and mouse/keyboard units cuts error rate
- **Resilience:** Redundancy options take all aspects of security into account
- **Quality:** High-quality, robust furniture “made in Germany!”

It is the centerpiece of safety in Hanover's local public transport system: the new protec service GmbH operations control center. Messages of all kinds, emergency calls and alarms come together here. State-of-the-art security technology is available for monitoring. If alarms are reported, the control center staff take

over the coordination of all further measures.

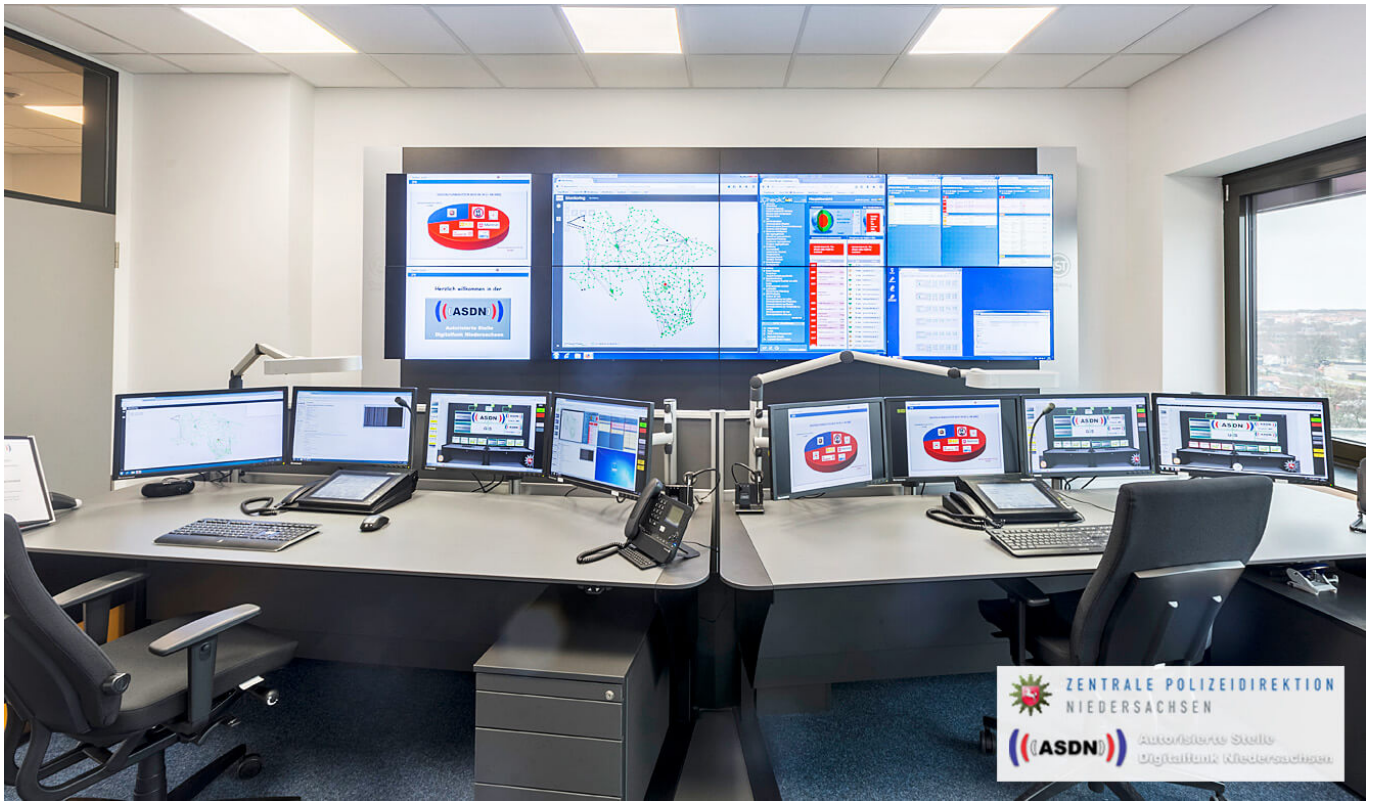

Latest level of technology is used in the Bremen police video control center to monitor dangerous hotspots such as the station area. The alarm system allows incoming messages and emergency calls to be automatically displayed on the video wall. This enables police operators to take appropriate action without delay and coordinate rescue services, for example.

Certified as an alarm receiving center and emergency call and service control center – in Hanover, the security service NWSG, in cooperation with JST, has implemented a control center in which security has top priority. Special software and state-of-the-art ergonomic and technical workstations are used for monitoring and alerting. Two proactive video walls also enable the automatic connection of incoming messages.

Whether emergency call center, service control center or alarm receiving center – like here, Charité CFM Facility Management GmbH sometimes receives thousands of alarms every day. To ensure the safety of people, properties and facilities, employees are expected to react quickly and track alarms correctly in order to coordinate the fire and rescue services in the event of danger.

Indispensable in the event of a situation briefing or disaster: the ASDN (Autorisierte Stelle Digitalfunk Niedersachsen) of the Central Police Directorate of Lower Saxony. Fire and rescue services as well as hundreds of police units rely on a highly available digital radio network, which is made possible by innovative JST components.

A visual and technical asset for traffic monitoring: the Hamburg traffic control center. Triggering height control in the Elbe tunnel, collisions on the main arterial roads or traffic jams – the employees can switch on the required camera images from any location in the event of an alarm. The advanced video wall technology enables the police to undertake virtual “patrols” on the video wall.

Ventilation systems fail, one of the nearly 100 elevators gets stuck unnoticed – state-of-the-art security technology makes it possible to prevent such scenarios on the Messe Berlin GmbH site. With the JST components used, the employees at the control center have a secure and proactive alarm management system at their disposal.

The business location THE SQUAIRE at Frankfurt International Airport is exceptional in many respects. This also applies to Fraport AG's emergency and service control center, whose employees are responsible for safety on site. Stefan Ertl, Head of Fire Protection and Security, comments: "Our team praises the Jungmann system, which not only simplifies the work, but also makes it safer".

The operational center of the European Union Agency for the Operational Management of Large-Scale IT Systems (eu-LISA) uses an innovative control center concept from JST to fulfill the Europe-wide tasks of the Brussels authority. Maximum availability, proactive processes, an optimum overview of all systems and absolutely secure handling are of fundamental importance there.

Experience more at a planning workshop in the control room simulator

Having visions of the future is good. Experiencing is better! Visit the control room simulator, unique in Europe, where state-of-the-art technology and the latest ergonomic know-how are combined. The control room of the future. **The special feature:** Here you can touch everything and try it out for yourself.

MAKE AN APPOINTMENT

Whether virtual or live on site – the workshop in the control room simulator is **free of charge**.
